

LISTING OF CLAIMS:

19. New) A display device for a working machine, comprising:

a display screen;

a plurality of state indication mark indicating the state of the working machine being displayed on the display screen in an indicative state, a predetermined state indication mark switching to an unindicative state when a change occurs in a state of the working vehicle; and when switched to the unindicative state, the predetermined state indication mark no longer being viewed on the display screen;

a caution mark indicating an abnormality in the state of the working machine, the caution mark not being displayed on the display screen while there is no change in the state of the working vehicle;

wherein, while the state of the working machine makes no change, plurality of state indication marks being displayed in the display screen in the indicative state, and

wherein, when the abnormality in the state of the working machine occurs that is independent of operator input; the predetermined state indication mark, as displayed in a predetermined one of individual display segments in the display screen, is switched to the unindicative state and the caution mark is displayed in the predetermined one of individual display segments.

20. (New) A display device for a working machine, comprising:

a display screen;

a state indication mark indicating the state of the working machine being displayed on the display screen in an indicative state, a predetermined state indication mark switching to an unindicative state when a change occurs in a state of the working vehicle; and when switched to the unindicative state, the predetermined state indication mark no longer being viewed on the display screen;

a caution mark indicating an abnormality in the state of the working machine, the caution mark not being displayed on the display screen while there is no change in the state of the working vehicle;

wherein, while the state of the working machine makes no change, the predetermined state change indication mark is displayed in a predetermined one of individual display segments of the display screen and other of the plurality of state indication marks are displayed in individual display segments other than the predetermined one of individual display segments,

wherein, when the abnormality in the state of the working machine occurs that is independent of operator input, the predetermined state change indication mark, as displayed in the predetermined one of individual display segments, is switched to the unindicative state and the caution mark is displayed in the predetermined one of individual display segments.

21. (New) A display device for a working machine according to claim 19, wherein the predetermined state indication mark displayed in the predetermined one of individual display segments has a lowest priority for the display of the state indication marks displayed in the individual display segments on the display screen.

22. (New) A display device for a working machine according to claim 19,
wherein the working machine includes a running equipment and a working equipment,
and

wherein, in another of the individual display segments on the display screen other than
the predetermined one of individual display segments, at least one other state indication mark
that indicates the running state and/or the working state of the working machine is displayed, and
a display in the another of the individual display segments is not changed when the abnormality
in the state of the working machine occurs.

23. (New) A display device for a working machine according to claim 19,
wherein the caution mark is made to correspond to the predetermined state indication
mark, and

wherein, when a change corresponding to the caution mark occurs while the caution mark
is being displayed in the predetermined display segment, the predetermined state indication mark
is made indicative and both the caution mark being displayed and the predetermined state
indication mark are displayed in the predetermined one of individual display segments.

24. (New) A display device for a working machine, which comprises:
a display screen including display segments respectively displaying a plurality of marks
without caution marks, wherein:

when a predetermined signal is inputted from a sensor arranged in the working machine
that is independent of operator input, a predetermined one of the plurality of marks being

displayed on the display screen is made unindicative by removing display thereof and a caution mark corresponding to the predetermined signal is displayed in the display segment where the predetermined mark was displayed.

25. (New) A display device for a working machine, comprising:

a plurality of marks being displayed on a display screen, a predetermined mark being displayed in a predetermined segment on the display screen,

wherein, when a predetermined signal is inputted that is independent of operator input, the predetermined mark is displayed in a reduced scale, and

wherein a mark different from the reduced and displayed mark is displayed in a portion of the predetermined display segment where the reduced and displayed predetermined mark is displayed.

26. (New) A display device for a working machine, comprising:

a plurality of marks being displayed on a display screen, and when a predetermined signal is inputted that is independent of operator input, a predetermined mark corresponding to the predetermined signal is displayed in a display segment different from a display segment of the plurality of marks,

wherein a second enlarged predetermined mark is displayed for a predetermined time period over the predetermined one of the plurality of marks displayed on the display screen.

27. (New) A display device for a working machine according to claim 20, wherein the predetermined state indication mark displayed in the predetermined one of individual display segments has a lowest priority for the display of the state indication marks displayed in the individual display segments on the display screen.

28. (New) A display device for a working machine according to claim 20, wherein the working machine includes a running equipment and a working equipment, and wherein, in another of the individual display segments on the display screen other than the predetermined one of individual display segments, at least one other state indication mark that indicates the running state and/or the working state of the working machine is displayed, and a display in the another of the individual display segment is not changed when the abnormality in the state of the working machine occurs.

29. (New) A display device for a working machine according to claim 20, wherein the caution mark corresponds to the predetermined state indication mark, and wherein, when a change corresponding to the predetermined state change indication mark occurs while the caution mark is being displayed in the predetermined display segment, the predetermined state indication mark is made indicative and both the caution mark being displayed and the predetermined state change indication mark are displayed in the predetermined one of individual display segments.

30. (New) A display device for a working machine according to claim 19, wherein a display size of at least one of the plurality of state indication marks other than the predetermined state indication mark is reduced, when the abnormality in the state of the working machine occurs.

31. (New) A display device for a working machine according to claim 20, wherein a display size of at least one state indication mark other than the predetermined state change indication mark is reduced, when the abnormality in the state of the working machine occurs.

32. (New) A display device for a working machine according to claim 19, wherein the caution mark has an enlarged area compared to the predetermined one of the individual display segments made unindicative, when the abnormality in the state of the working machine occurs.

33. (New) A display device for a working machine according to claim 20, wherein the caution mark has an enlarged display area when the state of the working vehicle makes a change compared to an unchanged display area, when the abnormality in the state of the working machine occurs.

34. (New) A display device for a working machine, which comprises:
a display screen including a display segment for displaying a state indication mark indicating the state of the working machine and a caution mark indicating a change in the state of the working machine; wherein:

while there is no change in the state of the working machine, the display screen displays a plurality of the state indication marks where the state indication marks are respectively displayed in display segments of the display screen; and

when the state of the working machine changes independent of operator input, one of the state indication marks is made unindicative by removing display thereof, and the caution mark is displayed in the display segment corresponding to the one of the state indication marks made unindicative.

35. (New) A display device for a working machine, which comprises:

a display screen including a display segment for displaying a state indication mark indicating the state of the working machine and a caution mark indicating a change in the state of the working machine; wherein:

while there is no change in the state of the working machine, the display screen displays one of the state change indication marks in a predetermined one of individual display segments of the display screen and other state indication marks are displayed in individual display segments other than the predetermined one of individual display segments; and

when the state of the working machine changes independent of operator input, the one of the state change indication mark is made unindicative by removing display thereof and a caution mark is displayed in the predetermined one of individual display segments.
